

PRISTHA DIGITAL

Multi-Tenant SaaS Publishing Ecosystem | Business Requirements Document

Executive Vision: To transform the fragmented writing landscape of Bangladesh into a structured digital economy. By providing "Sudo-Writers" (Facebook content creators) and traditional "Publishing Houses" with a secure, monetized, and interactive portal, we create a sustainable path from digital content to physical publishing.

1. Business Objectives & Strategy

Pristha Digital aims to solve the core inefficiencies in the BD publishing market through three strategic angles:

1.1 Social-to-SaaS Conversion

Currently, thousands of writers post high-engagement stories on Facebook for free. Pristha provides the infrastructure to "Pay-wall" this content. By mimicking the social feed experience but adding a "One-tap bKash unlock," we convert social likes into actual revenue.

1.2 The B2B Digital Warehouse

Publishing houses hold massive amounts of back-stock that are no longer in print. We provide a Multi-Tenant SaaS where each house manages its own storefront, sells digital copies of rare books, and tracks sales with real-time analytics.

1.3 Data-Driven Scouting (B2B Bridge)

We reduce the risk for physical publishers by providing data on what digital books are actually selling. This creates a marketplace where publishers can "buy the rights" to physically print trending digital books.

2. Detailed User Roles

User Type	Core Needs	Primary Action
Individual Author	Easy writing interface, fan management, secure selling.	Write, upload, and sell "Early Access" PDFs or Chapters.
Publishing House	Brand isolation, inventory control, sales reporting.	Bulk upload catalog and scout new authors.
Reader	Seamless mobile reading, easy payment, library access.	Unlock content via bKash/Nagad and read in-portal.

3. High-Priority Functional Requirements

- **Secure PDF Portal (DRM):** A proprietary web-based reader that prevents downloads and uses fragmented loading (rendering page-by-page as canvas/SVG) to stop piracy.
- **Dynamic Watermarking:** Real-time overlay of user's mobile number and email across the text to discourage screenshots.

- **Author 'Studio' Editor:** A rich-text editor that allows writers to draft content, set pricing for "Unfinished" works, and send "Invitations" to reviewers.
- **Multi-Tenant Infrastructure:** Individual dashboards for publishers to manage their own "White-labeled" storefronts within the main portal.
- **Physical Print Licensing:** A dedicated workflow where publishers can send "Offers" to authors for physical rights, managed legally within the platform.

4. Monetization & Revenue Model

- **Transaction Fee:** 12% - 15% commission on every digital sale.
- **SaaS Subscription:** Monthly tiered plans for Publishing Houses (Basic, Pro, Enterprise).
- **The "Agency" Fee:** A flat fee or 5% royalty on physical book contracts initiated through the platform's scouting data.
- **Premium Reading Pass:** A monthly subscription for readers to access "All-You-Can-Read" from participating publishers.

5. Technical Considerations (The Developer Moat)

As a platform built on a Java/Ubuntu stack, the focus remains on high security and modularity:

- **Security:** OAuth2/OpenID for user management; JWT-based stateless sessions for scalability.
- **Concurrency:** Optimized for high-concurrency during the "Amar Ekushey Boi Mela" season.
- **Payments:** Integration with SSLCommerz to support all local MFS (Mobile Financial Services).
